Functional principle

Glass or plastic fibers are the optimum choice for high-temperature applications and limited spaces. Optical fibers transfer the light from the sensor to a remote object. Single optical fibers are suited for opposed sensing mode, while bifurcated optical fibers are best suited for diffuse sensing mode.

The basic units of the third generation of the DF-G series offer very long ranges with standard optical fibers. You have also two 4-digit 7-segment displays for simultaneous display of limit value and instant reading of the amount of received light.

Via the multifunction button, you can make various settings and change the switching threshold.
